

CS2134 Homework 9 Spring 2016

Today? 2016

Written Part:

- 1) $O(n \log(n))$ where n is the amount of lines in the data file. It runs the find method for each line of the file, aka it performs $\log(n)$ n times
- 2) Initial

After inserting 12, violation 1 means recolor

insert 44 with no problem

insert 50 and come up with a case 3 and rotate

- 3) do not turn in
- 4) Node* K1 = K2->right;
K2->right = K2->left;
K1->left = K2->right->right;
K2->right->right = K1;
- 5) It shouldn't take more than 4 pointer changes to complete a rotation.
That would include switching the initial pointer to one of the children, and then changing the right right to be the right and the original to be the left.
- 6) That could be a problem because if you mod a number that's multiplied by 4 by any of those numbers, the remainder will be 0.

	4731	6173		
	4731			
	4731, 26	3327		

	4731	26	3327	1323		4340		4199		9679
--	------	----	------	------	--	------	--	------	--	------

B)

		4371		1323,6173	4199,4344,9679
		4371		1323	4199,4344,9679

		4371				1323,6173			4199,4344,9679,3324		
	4371		1323,6173	4199,4344,9679						21
